

ABSTRACT OF THE DISCLOSURE

A combination sunshade and luggage carrier which includes four housings, are arranged in a rectangular configuration. Each of the housings contains a flexible sunshade which is mounted on a roller. The housings are mounted on a linkage mechanism which is mounted in the roof of an automobile. The linkage mechanism can move the housings from a storage position in which the housings are in the confines of the automobile roof to an operating position in which the housings are above the roof. In the operating position, the sunshades can be extended to protect the automobile from solar heating. Luggage may be placed in a space defined by the housings and lashed to the housing.
